

ABSTRACT

A swab for removal of water inside the ears adapted to effectively and painlessly remove the water remaining in the external auditory meatus after swim or 5 bath that might cause discomfort and auditory inflammation, integrally comprises a long conical shape, which is wholly made of high water-absorbing material. One end is a thick handle part which has appropriate solidity, the other end is a thin pointed part which is very soft and supple. The thick handle part is adequately solid to grip with fingers and as it goes to the thin pointed part, it becomes gradually soft and supple.
